CHAMPAGNE, LUNA

ART UNIT

PAPER NUMBER

3627

MAIL DATE

DELIVERY MODE

04/29/2009

PAPER

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Office Action Summary	Application No. 10/708,547	Applicant(s) BEENAU ET AL.	
	Examiner LUNA CHAMPAGNE	Art Unit 3627	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 30 January 2009.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-17, 19 and 20 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-17, 19 and 20 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Applicant's correspondence received on 1/30/09 is acknowledged. Claims 1-17, 19, 20 are presented for examination. Claim 18 is cancelled.

Claim Rejections - 35 USC § 103

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. Claims 1-7, 9-12, 14, 19, and 20 are rejected under 35 U.S.C. 103(a) as being unpatentable over Seidman et al. (US 6671358 A1), as supported by the provisional (60/286309), in view of Johnson, Jr. (6,185,307 B1), in further view of Atalla (4,268,715).

Re claim 1, Seidman et al. disclose a system for securing a Radio Frequency (RF) transaction comprising: a RADIO FREQUENCY IDENTIFICATION (RFID) transaction device operable to send an RF transmission (*See e.g. col. 2, lines 36-42*).

Seidman et al. do not explicitly disclose a system comprising the transaction device including a database for storing a transaction device identifier and a transaction device authentication tag, wherein the transaction device identifier is different from the transaction device authentication tag; a transaction device random number generator for generating a transaction device random number, a transmitter operable to transmit the transaction device identifier, the transaction device

Art Unit: 3627

authentication tag, and the transaction device random number; wherein the transaction device is validated based at least in part on both the transaction device identifier and the transaction device authentication tag, both having been received from the RFID transaction device; and wherein the transaction device random number is used to lookup a previously stored decryption key for decrypting at least one of the transaction device identifier and the transaction device authentication tag, the transaction device random number having been received from the RFID transaction device.

However, Johnson JR. discloses a system comprising the transaction device including a database for storing a transaction device identifier and a transaction device authentication tag, wherein the transaction device identifier is different from the transaction device authentication tag (*See e.g. col. 9, lines 1-4*); a transaction device random number generator for generating a transaction device random number (*See e.g. col. 10, lines 38-41*), a transmitter (*transmitter 106*) operable to transmit the transaction device identifier, the transaction device authentication tag, and the transaction device random number (*See e.g. col. 6, lines 33-43*); wherein the transaction device is validated based at least in part on both the transaction device identifier and the transaction device authentication tag, both having been received from the RFID transaction device (*See e.g. col. 24, lines 44-49 – the code is transmitted to the host 300 to authenticate the tag. Each tag has a different authentication code, which is generated from the tag ID*).

Therefore, it would have been obvious to a person of ordinary skill in the art, at the time of the invention, to modify Seidman et al., and include the steps comprising a transaction device random number generator for generating a transaction device random number , a transmitter operable to transmit the transaction device identifier, the transaction device authentication tag, and the transaction device random number; wherein the transaction device is validated based at least in part on both the transaction device identifier and the transaction device authentication tag, both having been received from the RFID transaction device; as taught by Johnson JR., in order to further secure transactions and prevent unauthorized interception of valuable information.

Seidman et al., disclose an RFID transaction device. Seidman et al., in view of Johnson JR. do not explicitly disclose the steps wherein the transaction device random number is used to lookup a previously stored decryption key for decrypting at least one of the transaction device identifier and the transaction device authentication tag, the transaction device random number having been received from the RFID transaction device.

However, Atalla discloses the steps and wherein the transaction device random number is used to lookup a previously stored decryption key for decrypting at least one of the transaction device identifier and the transaction device authentication tag, the transaction device random number having been received from the transaction device (*see e.g. col. 4, lines 65-67; col. 5, lines 47-54 where, during a*

Art Unit: 3627

transaction, a decryption module at the processing station decrypts an encrypted message sent by a user device using a transmitted random number).

Therefore, it would have been obvious to a person of ordinary skill in the art, at the time of the invention, to modify Seidman et al., in view of Johnson JR, and include the steps comprising a transaction device random number used to lookup a previously stored decryption key for decrypting at least one of the transaction device identifier and the transaction device authentication tag, the transaction device random number having been received from the transaction device, as taught by Atalla, in order to provide secure data transmission, via a multilevel encryption, during the authentication of the transaction.

Re claim 2, Seidman et al. disclose a system wherein further comprising: a RFID reader in communication with said transaction device; a merchant Point of Sale (POS) device in communication with said RFID reader (*See e.g. col. 2, lines 43-47*); and an account authorizing agent in communication with said merchant POS (*See e.g. col. 17, lines 9-12*).

Re claims 3, 4, Seidman et al. disclose a system wherein said RFID reader comprises: a reader random number generator for producing a reader random number a system wherein said RFID reader further comprises: a processor in

Art Unit: 3627

communication with said reader random number generator; and a system wherein a reader database for storing a RFID reader identifier (*See e.g. col. 13, lines 17-25*);

Re claim 5, Seidman et al. disclose a system wherein said transaction device random number generator is operable to provide said transaction device random number to said RFID reader, said reader operable to provide said transaction device random number to said POS, said POS configured to provide the transaction device random number to said account authorizing agent system (*See e.g. col.13, lines 17-25*).

Re claims 6, Seidman et al., disclose system wherein said RFID reader is operable to provide said transaction device identifier to said merchant POS (*See e.g. col. 22, lines 51-59*).

Re claims 7 and 12, it would have been a design choice, at the time of the invention, to have at least one of said transaction device identifier and said transaction device random number provided to said RFID reader in track 1/track 2 International Standards Setting Organization format, in order to synchronize the system.

Re claim 9, Seidman et al. do not explicitly disclose a system wherein said authorizing agent system is configured to validate said transaction device identifier in

Art Unit: 3627

accordance with said transaction device random number (*See e.g. col. 18, lines 42-51*).

However, Johnson JR. discloses a system wherein said authorizing agent system is configured to validate said transaction device identifier in accordance with said transaction device random number (*See e.g. col. 11, lines 22-35*).

Therefore, it would have been obvious to a person of ordinary skill in the art, at the time of the invention, to modify Seidman et al., and include the steps wherein said authorizing agent system is configured to validate said transaction device identifier in accordance with said transaction device random number, as taught by Johnson JR., in order to authenticate the device.

Re claim 10, Seidman et al. disclose a system wherein said RFID reader random number generator is operable to provide said reader random number to said POS, said POS configured to provide at least one of said transaction device random number, transaction device identifier, and reader RFID reader random number to said account authorizing agent system (*See e.g. col. 22, lines 48-59, col. 17, lines 9-12*).

Re claims 11 and 14, Seidman et al. disclose a system wherein said RFID reader is operable to provide at least one of said transaction device random number, transaction device identifier, and reader RFID reader random number to said merchant POS; a system wherein said authorizing agent system is configured to validate at least one of said transaction device and said RFID reader, in accordance

Art Unit: 3627

with said at least one of said transaction device random number, transaction device identifier, and reader RFID reader random number transaction device random number (*See e.g. col. 17, lines 9-42*).

Re claims 19 and 20, Seidman et al., do not explicitly disclose a method wherein the transaction device random number is converted to a validating code and then used to validate the transaction device; a new transaction device random number is generated for each transaction.

However, Johnson JR. discloses a method wherein the transaction device random number is converted to a validating code and then used to validate the transaction device (*see e.g. col. 11, lines 33-35-67*); a new transaction device random number is generated for each transaction (*see e.g. col. 13, lines 65-67*).

Therefore, it would have been obvious to a person of ordinary skill in the art, at the time of the invention to modify Seidman et al., and include a method wherein the transaction device random number is converted to a validating code and then used to validate the transaction device; a new transaction device random number is generated for each transaction, as taught by Johnson JR., in order to alter the authentication process in such a way that only authorized devices can communicate with each other.

3. Claims 8 and 13 are rejected under 35 U.S.C. 103(a) as being unpatentable over Seidman et al. (US 6671358 A1), as supported by the provisional (60/286309), in

Art Unit: 3627

view of Johnson, Jr. (6,185,307 B1), in further view of Atalla (4,268,715), in further view of Official Notice.

Re claims 8 and 13, Seidman et al., in view of Johnson JR. do not explicitly disclose a system wherein at least one of said transaction device identifier and said transaction device random number is provided to said RFID reader in POS pre-defined format.

However the Examiner takes Official Notice that it is well known in the art that a recognizable format should be provided to a receiving system in a network.

Therefore, it would have been obvious to a person of ordinary skill in the art, at the time of the invention to include a transaction device identifier and wherein said transaction device random number is provided to said RFID reader in POS pre-defined format, in order to synchronize the system.

4. Claims 15 and 16 are rejected under 35 U.S.C. 102(e) as being unpatentable by Johnson, Jr. (6,185,307 B1), in further view of Atalla (4,268,715).

Re claim 15, Johnson JR. discloses a method for securing a transaction comprising the steps of: providing a transaction device (tag unit 100), the transaction device including a random number generator (see e.g. col. 13, lines 44-46) , wherein the transaction device is associated with a transaction (*See e.g. col. 10, lines 61-65*); device identifier and a transaction device authentication tag, the transaction device identifier being different from the transaction device authentication tag generating a transaction device random number (*See e.g. col. 10, lines 38-41*); and transmitting the

Art Unit: 3627

transaction device identifier, the transaction device authentication tag, and the transaction device random number (*See e.g. col. 6, lines 33-43*): and validating the transaction device based at least in part on both the transaction device identifier and the transaction device authentication tag, both having been received from the transaction device (*See e.g. col. 24, lines 44-49*),

Johnson JR. do not explicitly disclose wherein the transaction device random number is used to lookup a previously stored decryption key for decrypting at least one of the transaction device identifier and the transaction device authentication tag, the transaction device random number having been received from the transaction device.

However, Atalla discloses wherein the transaction device random number is used to lookup a previously stored decryption key for decrypting at least one of the transaction device identifier and the transaction device authentication tag, the transaction device random number having been received from the transaction device (*See e.g. col. 51, lines 47-54*).

Therefore, it would have been obvious to a person of ordinary skill in the art, at the time of the invention, to modify Johnson JR, and include the steps comprising a transaction device random number used to lookup a previously stored decryption key for decrypting at least one of the transaction device identifier and the transaction device authentication tag, the transaction device random number having been received from the transaction device, as taught by Atalla, in order to provide secure

Art Unit: 3627

data transmission, via a multilevel encryption, during the authentication of the transaction.

Re claims 16, Johnson et al. disclose a method further including providing a transaction device reader, the reader including a reader random number generator; providing a reader random number generator for generating a reader random number; and validating at least one of the transaction device and the reader in accordance with at least one of the transaction device random number and the reader random number (*See e.g. col. 10, line 65-67, col.11, lines 13, 11-14, 28-35*).

5. Claim 17 is rejected under 35 U.S.C. 103(a) as being unpatentable over Johnson, Jr. (6,185,307 B1), in view of Seidman et al. (US 6671358 A1), as supported by the provisional (60/286309), in further view of Atalla (4,268,715).

6. Re claim 17, Johnson Jr. discloses a method for securing a transaction comprising the steps of: providing a transaction device (tag unit 100), the transaction device including a random number generator (see e.g. col. 13, lines 44-46) , wherein the transaction device is associated with a transaction (*See e.g. col. 10, lines 61-65*); device identifier and a transaction device authentication tag, the transaction device identifier being different from the transaction device authentication tag generating a transaction device random number (*See e.g. col. 10, lines 38-41*); and transmitting, from the transaction device, the transaction device identifier, the transaction device

Art Unit: 3627

authentication tag, and the transaction device random number to the transaction device reader; transmitting, from the transaction device reader, the transaction device identifier, the transaction device authentication tag, the transaction device random number, and the transaction device authentication tag to an account issuer associated with the transaction device (host 300) (*See e.g. col. 10, lines 41-44*);

Johnson JR. does not explicitly disclose validating, at the account issuer, the transaction device (*credit/debit card*) based at least in part on both the transaction device identifier (*credit/debit card number*) and the transaction device authentication tag (code 245), both having been received from the transaction device.

However, Seidman et al. disclose validating, at the account issuer, the transaction device (*credit/debit card*) based at least in part on both the transaction device identifier (*credit/debit card number*) and the transaction device authentication tag (code 245), both having been received from the transaction device (*See e.g. col. 18, lines 13-31*).

Therefore, it would have been obvious to a person of ordinary skill in the art, at the time of the invention to include the steps of validating, at the account issuer, the transaction device based at least in part on both the transaction device identifier and the transaction device authentication tag, both having been received from the transaction device, as taught by Seidman et al., in order to verify the validity of the transaction device.

Art Unit: 3627

Johnson JR., in view of Seidman et al. do not explicitly disclose the limitation wherein the transaction device random number is used to decrypt at least one of the transaction device reader authentication tag.

However, Atalla discloses such limitation in col. 5, lines 47-54.

Therefore, it would have been obvious to a person of ordinary skill in the art, at the time of the invention to modify Johnson JR., in view of Seidman et al., and include the steps wherein the transaction device random number is used to decrypt at least one of the transaction device identifier, and the transaction device authentication tag, as taught by Atalla, in order to provide secure data transmission, via a multilevel encryption, during the authentication of the transaction.

Response to Arguments

7. Applicant's arguments with respect to the previous claims have been considered, but are moot in view of the new grounds of rejection. The previous Non-Final Rejection is withdrawn. As disclosed in the new rejection, Applicant's limitation wherein the transaction device random number is used to lookup a previously stored description key is anticipated by Atalla.

Conclusion

8. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Luna Champagne whose telephone number is (571) 272-7177. The examiner can normally be reached on Monday - Friday 8:30 - 5:00.

Art Unit: 3627

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Florian Zeender can be reached on (571) 272-6790. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
